

## 1. Overview

This simple app, NearBy is a simple iOS app that connects to the Foursquare api, and using the user's current location generates a list of nearby venues, in a graphical interface similar to a flip clock.

Users should swipe their fingers up and down to move the flip, one at the time, and the flip should have a nice and smooth “3D-like” animation.

Don't worry to much about the visuals, you can use shades of grays and simple rectangles to build most of the pieces. Also, you can use the same icon for all categories.

## 2. Animations

The animation should mimic a real life flip clock:

The bottom half of the card should move with the user finger until it crosses the center position. When on the center position, it will finish the motion flipping all the way to finish the movement.

If the user swipes the finger up or down, the flip should do ao complete motion.
